

Engineering Statement / *Cover Letter*

Dear Hiring Team,

I am applying for the role because it aligns with how I already approach frontend engineering: thinking in systems, taking ownership beyond my own code, and focusing on long-term impact across products and teams. My primary stack is React and TypeScript, and I work on production-grade applications where architecture, performance, and maintainability are core priorities.

Recently, I have been contributing to the development of multiple AI-oriented React applications in a cross-functional product team, building customizable dashboards for complex real-time data and collaborating closely with backend engineers and graphic designers. I also led the migration of a legacy desktop ERP system into a modern Angular web application, helping translate desktop paradigms into scalable web architecture while mentoring a backend developer through the transition.

I closely follow the rapid evolution of AI tools and continuously adapt my workflows to improve both speed and quality. I use structured prompting, reusable engineering rules, planning workflows, and architectural decomposition to break complex features into smaller systems. This allows me to iterate faster, perform deeper code reviews, and explore better architectural solutions while maintaining a high standard of code quality.

Alongside product work, I also enjoy building projects that express the creative side of frontend development. I designed and developed the website for GNOS Records, a techno record label, as an exploration of expressive UI and interactive web design. I have also worked on performance-focused web projects, including optimizing video delivery for the 7Planets platform and building company websites with strong SEO and automated content pipelines.

I am particularly excited about teams that actively explore how AI can augment engineering workflows and help developers build better systems. The opportunity to contribute to frontend architecture in such an environment is something that strongly motivates me.
