

Engineering Statement

Dear Hiring Team,

I am a Frontend Software Engineer specializing in building scalable applications with React and TypeScript. My approach to software engineering was shaped by an early interest for mathematics and algorithmic thinking. Early in my career, my mentor required me to model every feature and task with UML before implementation. That discipline fundamentally changed how I approach software engineering by teaching me to think in systems before code.

Looking back, that experience naturally shifted my focus from implementing individual features to understanding the architecture behind them. Today I approach frontend engineering as designing interconnected systems instead of isolated components, which has also strengthened my communication and collaboration across engineering teams.

Over time, I realized frontend engineering gave me the opportunity to combine analytical problem solving with creativity. Every interaction a user has with a product is the result of engineering decisions, and I enjoy designing those systems just as much as implementing them.

Since then, I've experienced projects that challenge me beyond building interfaces. At JuraTech Group, I led the frontend migration of a legacy Visual Basic ERP system into a modern Angular application for a manufacturing company with highly specialized business rules across office and workshop operations. Beyond the technical migration itself, I collaborated closely with the project manager, worked across backend integrations, and mentored a new backend developer throughout the project.

More recently, I've been leading frontend development on AI-powered web applications prioritizing performance, architecture, and real-time communication. One application focused on monitoring and configuring CCTV cameras using live ONVIF streaming, while another allowed users to build AI workflows for analyzing those video streams. Due to the nature of the projects, I cannot discuss implementation details, but they challenged me to design both user-facing and developer-facing frontend architectures, implement custom streaming solutions, and build systems where performance and maintainability were essential.

While frontend engineering is my specialization, I've regularly worked with REST APIs, authentication, PostgreSQL, integrations, and backend developers. Those experiences kept expanding my knowledge of designing frontend systems that integrate cleanly.

I actively use modern AI tools to improve research, validate architectural ideas, automate repetitive work, and explore alternative solutions. While these tools accelerate development, thoughtful engineering and good technical judgment remain timeless.

I'm excited by the opportunity to contribute to a team that values engineering discipline. I enjoy collaborating across teams, designing maintainable architectures, and building products where long-term quality is considered as important as delivering new features.
